```

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                     Location/Qualifiers
                                                                                                                                                                                                         'product= "brnE"
                                                                                       Sahm H, Pfefferle
```

Ω

This invention describes a novel isolated polynucleotide

(I) containing

Claim 4 (i); Page 13; 23pp; German

000

a

```
CC at least one sequence that (1) is 70% identical with a sequence that CC encodes at least one of 251 amino acid (aa) (3) or 108 aa (5) (2) cip (3) encodes a polypeptide at least 70% identical with (3) (2) cr (5); (iii) is the complement of (1) or (ii), or (10) contains at least CC 15 consecutive bases from (1)-(iii). The invention also describes (a) (2) coryneform microorganisms, especially Corynebacterium, transformed with CC coryneform microorganisms, especially Corynebacterium, transformed with CC one or more (1), where these are replicative DNA; (c) production of CC branched-chain 1-aa by fermentation of coryneform bacteria in which the CC branched-chain 1-aa by fermentation of coryneform bacteria in which the CC branched-chain production of production of coryneform bacteria being CC especially overexpressed; and (d) method for isolating the brnE and/or CC brnF genes. (I) is used for transformation of coryneform bacteria being CC used for fermentative production of branched-chain amino acids, specifically leucine, isoleucine and valine, which are useful in medicine and animal nutrition. (I) can also be used as source of primers and CC probes for isolation of related sequences. Transformation with (I) CC corynebacterium glutamicum ATCC 14752 brnF and brnE proteins described in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

CC polypeptides; (ii) encodes a polypeptide at least 70% identical with (3) CC or (5); (iii) is the complement of (i) or (ii), or (iv) contains at least CE 15 consecutive bases from (i)-(iii). The invention also describes (a) CC corpneform microorganisms, especially Corynebacterium, transformed with CC one or more (I), where these are replicative DNA; (c) production of CC branched-chain L-aa by fermentation of coryneform bacteria in which the CC brill and/or bril genes (or equivalent sequences) are amplified, CC especially coverexpressed; and (d) method for isolating the bril and/or CC bril genes. (I) is used for transformation of coryneform bacteria being CC used for fermentative production of branched-chain mino acids, cc specifically leucine, isoleucine and valine, which are useful in medicine and animal nutrition. (I) can also be used as source of primers and corynebacterium glutamicum ATCC 13032 bril and bril proteins described in CC corynebacterium glutamicum ATCC 13032 bril and bril proteins described in CC the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches

AAH66 The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a nucleic acid described in the exemplification of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained

bring genes. (I) is used for transformation of coryneform bacteria being bring genes. (I) is used for transformation of coryneform bacteria being used for fermentative production of branched-chain amino acids, specifically leucine, isoleucine and valine, which are useful in medicine and animal mutrition. (I) can also be used as source of primers and probes for isolation of related sequences. Transformation with (I) increases yield of branched-chain amino acids. This sequence encodes the corynebacterium glutamicum ATCC 14752 brnF protein described in the method of the invention Sequence 753 BP; 140 A; 211 C; 194 G; 208 T; 0 U; 0 Other;	s invention describes a novel isolated polynucleotide (I) con least one sequence that (i) is 70% identical with a sequence pleast one of 251 amino acid (aa) (3) or 108 aa (5) yepptides; (ii) encodes a polypeptide at least 70% identical (5); (iii) is the complement of (i) or (ii), or (iv) contain consecutive bases from (i) (iii). The invention also describete the form sequences of 753 bp (2) or 324 bp (4); (b) yepform microorganisms, especially Corynebacterium, transform or (ii), where these are replicative DNA; (c) production or more (I), where these are replicative DNA; (c) production ched-chain L-aa by fermentation of coryneform bacteria in when the sequences of the production of the form of the production of the form sequences of the production of the form of the production of the productio	P-PSDB; AAB86247. New export genes from coryneform bacteria, useful for increasing fermentative production of branched-chain amino acids. Claim 5; Page 14-15; 23pp; German.	(DEGS) DEGUSSA AG.                                                                 The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from coryneform bacterium. And identifying a homologue of a gene derived mor coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a nucleic acid described in the exemplification of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Nakagawa

                                                                                                                                                                 This invention describes a novel nucleic acid array involving Corynebacterium glutamicum polynucleotides. The arrays are used to corynebacterium glutamicum, particularly for monitoring a fermentation process to determine expression levels of C. glutamicum cellular mRNA. Such monitoring particularly differentiates between expression levels of different strains of C. glutamicum and allows the adjustment of different culture and fermentation conditions. ACA00010-ACA02188 represent C. glutamicum derived polynucleotides described in the disclosure of the
                                                                                                                                                                                                                                                                                                New nucleic acid array useful for Corynebacterium glutamicum during from Corynebacterium glutamicum.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Corynebacterium glutamicum

These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a nucleic acid described in the exemplification of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 324 BP; 60 A; 79 C; 80 G; 105 T; 0 U; 0 Other;

The arrays are used to corynebacterium glutamicum, particularly for monitoring a fermentation process to determine expression levels of C. glutamicum cellular mRNA. Such monitoring particularly differentiates between expression levels of different strains of C. glutamicum and allows the adjustment of different culture and fermentation conditions. ACA00010-ACA02188 represent C. glutamicum derived polynucleotides described in the disclosure of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention describes a novel isolated nucleic acid (I) from coryneform bacteria used for the fermentative production of selected L amino acids, by fermenting the amino acid-producing coryneform in whice at least the lrg gene has been weakened or amplified, then isolating amino acids that have accumulated in the medium or cells. (I) is used transform coryneforms for production of L-amino acids, specifically lysine and isoleucine, which are used in medicine and particularly as animal feed supplement. It may also be used as probes and primers for isolating related sequences. Regulating expression of (I) improves production of amino acids, especially of L-lysine. This sequence encod a fragment of the Corynebacterium glutamicum lrp protein which is used the method described in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Permentation; L-amino acid production; lrp medicine; animal feed supplement; ds.

It may also be used as probes and particularly as isolating related sequences. Regulating expression of [1] improves production of amino acids, especially of L-lysine. This sequence encodes a fragment of the Corynebacterium glutamicum lrp protein which is used in the method described in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        coryneform bacteria used for the fermentative production of selected L amino acids, by fermenting the amino acid-producing coryneform in which at least the lry gene has been weakened or amplified, then isolating amino acids that have accumulated in the medium or cells. (I) is used transform coryneforms for production of L-amino acids, specifically lysine and isoleucine, which are used in medicine and particularly as animal feed sunniament.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              05-OCT-1999;

07-APR-2000;
03-AUG-2000;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a nucleic acid described in the exemplification of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nakagawa

                                                                                                                This invention describes a novel nucleic acid array involving Corynebacterium glutamicum polynucleotides. The arrays are used to corynebacterium glutamicum polynucleotides. The arrays are used to analyse C. glutamicum, particularly for monitoring a fermentation process to determine expression levels of C. glutamicum cellular mRNA. Such monitoring particularly differentiates between expression levels of different strains of C. glutamicum and allows the adjustment of different culture and fermentation conditions. ACA00010-ACA02188 represent C. glutamicum derived polynucleotides described in the disclosure of the

These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from coryneform bacterium, and identifying a homologue of a gene derived mo coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a nucleic acid described in the exemplification of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel polynucleotides derived from Coryneform bacteria, for identifying mutation point of a gene, measuring expression of a gene, analyzing expression profile or pattern of a gene and identifying homologous gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                WPI; 2001-376931/40.

The arrays are used to analyse C. glutamicum, particularly for monitoring a fermentation process to determine expression levels of C. glutamicum cellular mRNA. Such monitoring particularly differentiates between expression levels of different strains of C. glutamicum and allows the adjustment of different culture and fermentation conditions. ACA00010-ACA02188 represent C. glutamicum derived polynucleotides described in the disclosure of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        C. glutamicum derived ORF SEQ ID 1959.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ACA01968;

GENERAL INFORMATION:

APPLICANT: KENNERKNECHT, NICOLE

APPLICANT: SAHM, HERMANN

APPLICANT: SAEM, HERMANN

APPLICANT: BEGGELLING, LOTHAR

APPLICANT: PFEFFERLE, WALTER

TITLE OF INVENTION: NUCLECTIDE SEQUENCE CODING FOR THE EXPORT OF

TITLE OF INVENTION: BRANCHED CHAIN ANINO ACIDS, PROCESS FOR THE

TITLE OF INVENTION: ISOLATION THEREOF AND USE THEREOF

FILE REFERENCE: 21123/265496/MAS

CURRENT APPLICATION NUMBER: US/09/471,803A

CURRENT FILING DATE: 1999-12-23

PRIOR APPLICATION NUMBER: DE 199 51 708.8

PRIOR APPLICATION NUMBER: DE 199 51 708.8

PRIOR FILING DATE: 1999-10-27

NUMBER OF SEQ ID NOS: 12

SOPTWARE: Patentin Ver. 2.1

SEQ ID NO 2

LENGTH: 753

TYPE: DNA

ORGANISM: Corynebacterium glutamicum
